

VARIPHONE

V-SIL MOTO

A disturbing trend is noted in the field of motorcycling as more people become aware of a loss of hearing sensitivity due to their favorite sport.

Motorcyclists are beginning to realize the importance of protecting their hearing. Official measurements show that motorcyclists expose themselves to excessive noise levels that exceeds safety limits. It is not so much the noise generated by the motorcycle, but rather the wind noise that is of concern.

The sound pressure is approximately 90 dB at 80 km/hour, 94 dB at 100 km/hour, 98 dB at 120 km/hour and at a speed of 140 km/hour it can rise up to 102 dB. The noise

levels are also dependent on the type of the motorcycle and the type of helmet.

For this target group we offer the V-Sil MOTO.

This custom made hearing protector is made from a 50 Shore Silicon material and is appreciated for its quality and wearing comfort under most types of helmets. This hearing protector is equipped with a selective filter. A large range of very stable metal "LASER calibrated ST - filters" are available and an Ear-O-Tec technician will be able to assist you with the selection of an appropriate filter to guarantee maximum protection for your circumstances.
